

TAD TMD TBD

STANDARD AIR HANDLING UNIT

TICA CENTRAL AIR-CONDITIONING

CA-TAD/TMD/TBD-201610V01

www.ticachina.com

TICA is a hi-tech enterprise specialized in R&D, manufacturing, sales and services of air-conditioning and refrigeration products. Established in 1991, it has developed into one of the top four Chinese air-conditioning brands, with factories in Nanjing, Tianjin and Guangzhou, and a network of over 70 sales and service filiales around the world.

TICA has invested up to RMB 600 million in the first phase to build the top notch central air-conditioning R&D and production base, credited as the state enterprise R&D center. Certified by CNAS, it serves as a national R&D public service platform.

TICA produces over 30 series of products, covering AHUs, VRFs, screw chillers and centrifugal chillers, diverse enough to meet various requirements with regards to comfort and manufacturing processing application.

TICA is a strong competitor in chillers and commercial air conditioning products. It is the largest producer of AHUs in China for five consecutive years and covers over 40% of the market share as the supplier to such industries as micro-electronics, surgery operation room equipment and biopharmaceuticals.

TICA has established a global strategic joint venture with United Technologies Corporation (UTC) whose businesses include the world's most advanced Pratt & Whitney Aircraft Engines, the largest air-conditioning company Carrier and the biggest elevator company Otis.

The giant UTC transfers such global cutting-edge core technologies as large centrifugal chillers, screw chillers, and ORC systems to TICA, thrusting TICA 20 years ahead of its Chinese counterparts in terms of centrifuge technology and 30 years ahead in cryogenic power generation technology. Meanwhile, TICA and UTC will integrate global resources to create a brand-new international market pattern.

Meanwhile, the company has also provided energy-saving air-conditioning system integration solutions to both domestic and foreign users like Zhongnanhai, the Great Hall of the People, Beijing Bird's Nest stadium, the Water Cube, the Wukesong Indoor Stadium, Petro China, Sinopec, State Grid, Nanjing Panda, Hangzhou Xiaoshan Airport, Hainan Airlines Group, Shangri-La Hotel, Manila Ocean Park, Abu Dhabi Al Muneera, SM City in Philippines and Unilever, etc.

Features

Patented structure, excellent thermal insulation property

TICA patented design of labyrinth seal structure formed by using aluminum sections with concave and convex chamfer at joints of AHU body and tightening with bolts and nuts. The panel is made of high-quality paint-coated panel and galvanized steel sheet which provide good fire and corrosion resistance. The inner panel can also be made of stainless steel to meet the requirements of different customers.

Robust structural design

TICA labyrinth AHU has an aluminum alloy frame and a hidden metal inner frame, in which the former constitutes a rigid body with high resistance to torsion by using a tenon structure and tightening with bolts and nuts, while the latter greatly improves the strength of the unit.

Prevention of cold bridge and rust

All metals inside TICA labyrinth AHU are isolated from those outside by means of polyurethane foaming and specially designed seals, eliminating insulation strips commonly used in general AHUs and therefore preventing the cold bridge. Frames of aluminum sections are embedded around all panels, completely isolating corners of metal panel from air and moisture and thereby preventing rust spot on panels.

Professional selection software

The cooling coils and heating coils are selected by professional selection software which is programmed in strict accordance with laws of engineering and modified according to actual service of coils to provide more reliable software.

World-class designed cooling and heating coils

Coils feature high-quality copper tubes combined with unique corrugated fin; the heat exchanger with excellent heat transfer is produced by means of advanced mechanical expanding.

Corrugated control damper for flexible adjustment

Manual or automatic mode is available. The split corrugated linked control damper opens flexibly, with low air resistance and excellent sealing performance, which can be operated manually or by an additional electric controller.

Optimized design fan and motor, with low noise and high efficiency

The fan impeller and pulley are corrected through static and dynamic balance, and the fan is corrected through the running vibration test for stable operation. On the base that shared by the fan and its motor, there is a shock absorber. And a flexible connector is located between the fan outlet and the AHU body, which is isolated from moving parts for shock isolation.

Mechanical-electrical control

Mechanical-electrical thermostat

Thermostat

Grand appearance and large LCD, giving an impression of high-class, one-key start, automatic operation;
Light touch on buttons provides a display of several states;
Highly reliable single-chip microcomputer with strong resistance to interference
Small size, wall mounting, simple and convenient

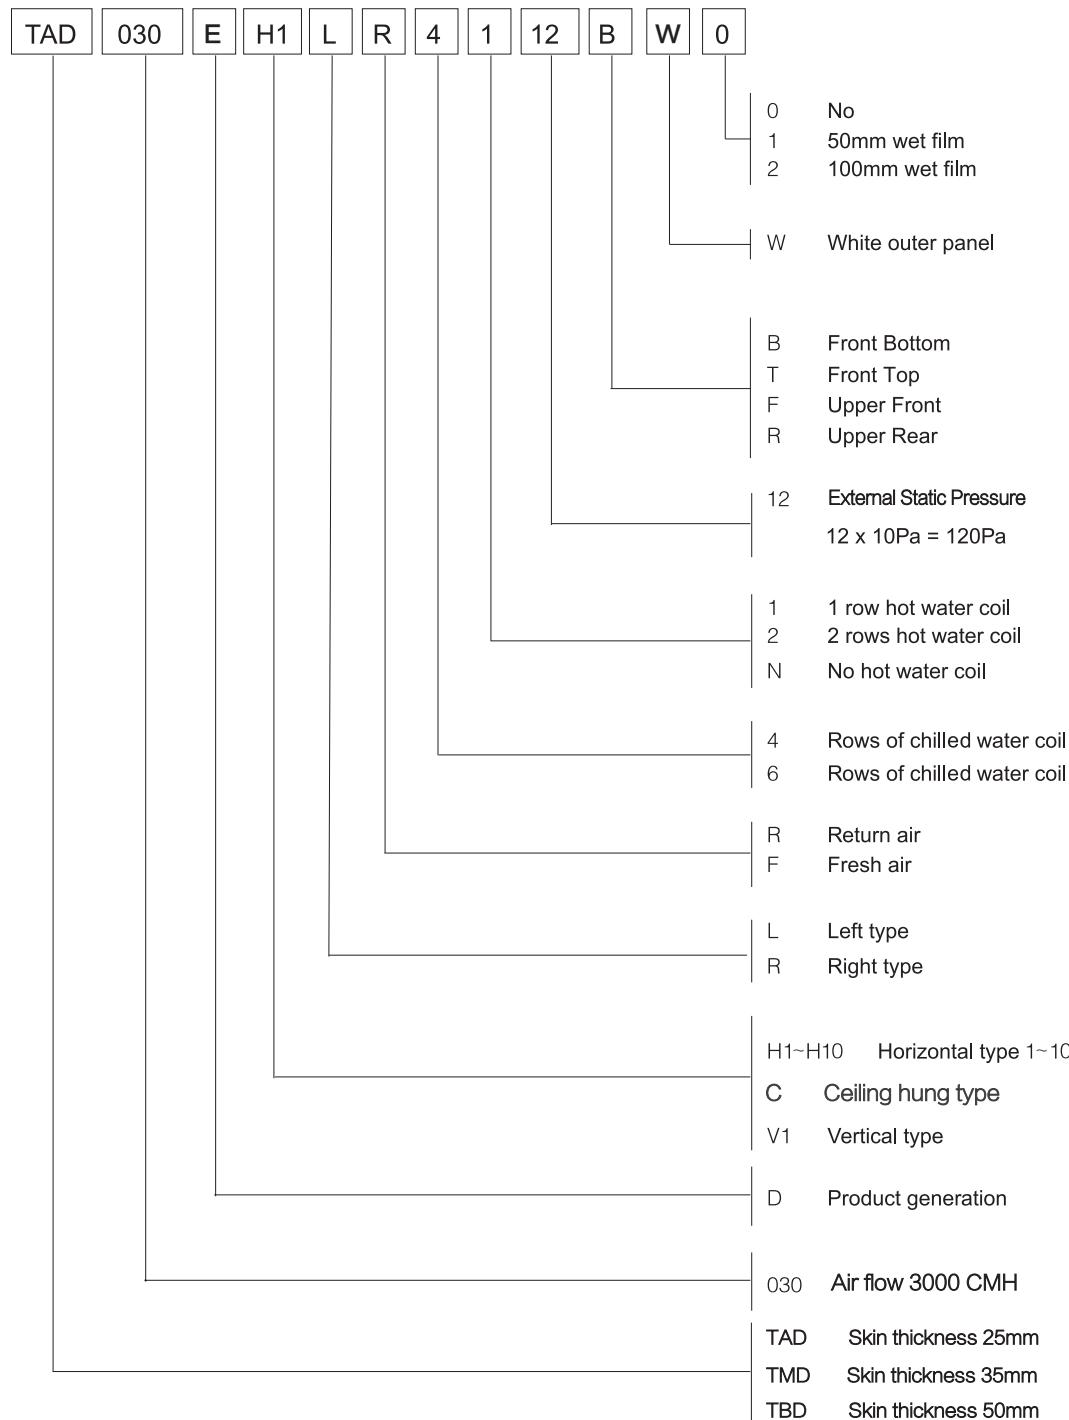

Mechanical-electrical control cabinet

Cabinet

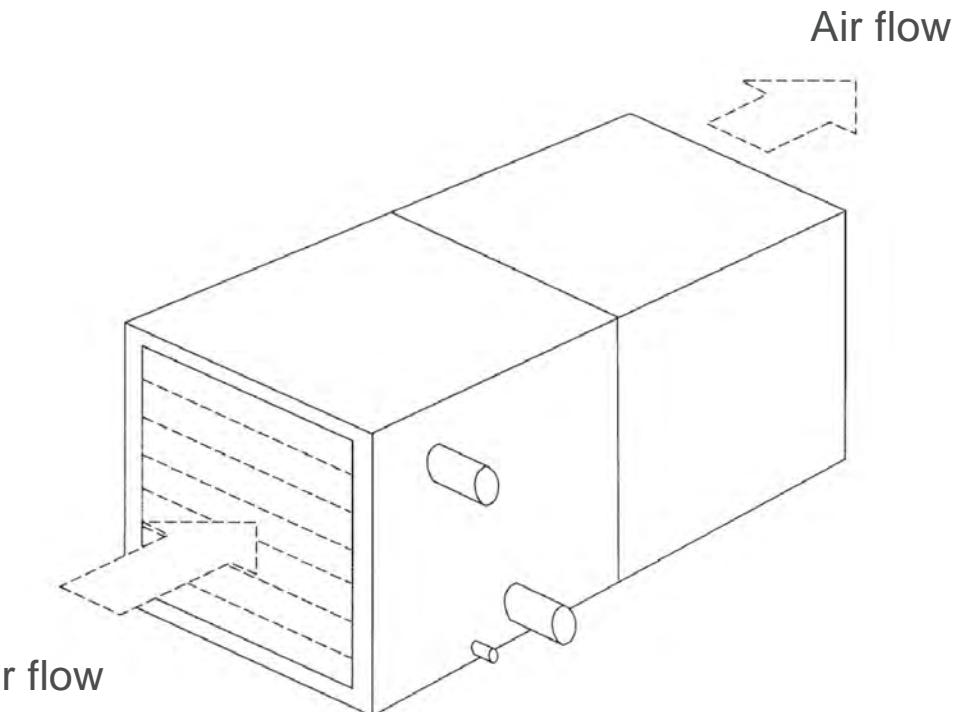

Professional design, integrated control, reasonable wiring, complete protection;
Standardized design, development, procurement, prompt delivery, fast installation;
Main elements of famous international brands (Schneider/LG/TICA) for reliable and guaranteed quality;
Various external interlocks, reserved FRD and fresh air valve (on and off at the same time as forced draft fan), water valve control signal;
For motor power ≤ 7.5 kW, control cabinet is installed together with the unit, eliminating secondary purchase and installation, with simple field connection and fast installation, saving labor and space.

Nomenclature

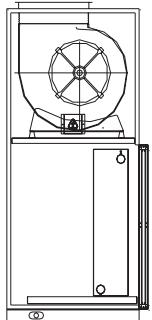

Method To Determine The Side Of Unit

The unit is left type

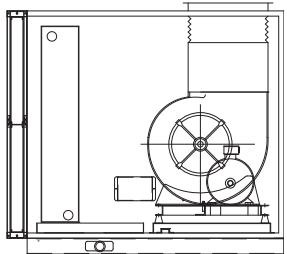

Facing the air flow, if water piping at left side indicates left type. Otherwise, right type.

★ Note

- Cooling capacity is based on the following:
 - Water temperature : 7°C (inlet)/12°C (outlet)
 - Air entering condition : 27°C DB/19.5°C WB
- Heating capacity is based on the following (with same water flow rate as cooling cycle):
 - Water temperature : 60°C (inlet)
 - Air entering condition : 15°C DB
- The manufacturer reserves the rights to make changes to the above specifications without prior notice.

★ Note

- Cooling capacity is based on the following:
 - Water temperature : 7°C (inlet)/12°C (outlet)
 - Air entering condition : 35°C DB/28°C WB
- Heating capacity is based on the following (with same water flow rate as cooling cycle):
 - Water temperature : 60°C (inlet)
 - Air entering condition : 7°C DB
- The manufacturer reserves the rights to make changes to the above specifications without prior notice.
- In order to control water pressure drop, the temperature difference of entering and leaving water exceeds 5°C.

★ Note

- Heating coils ≤ 2 rows.
- Wet-film thickness ≤ 100mm.
- If panel filter instead of external slide filter ,the length of A plus 40mm.
- The fan outlet direction of DV1 is UF.
- The dimension above is TAD.The width and height of TMD is 20mm more than TAD.The width and height of TBD is 50mm more than TAD.
- Heating coils ≤ 2 rows.
- Wet-film thickness ≤ 100mm.
- TAD400~500EH unit has double cooling coil.
- If panel filter instead of external slide filter ,the length of A plus 40mm.
- If the fan outlet is FT, C which in the table above need to minus 40mm
- The dimension above is TAD.The width and height of TMD is 20mm more than TAD.The width and height of TBD is 50mm more than TAD.

High-pressure spray humidifier

The high-pressure spray humidifier consists of distribution pipe, nozzle of stainless steel and spray humidifying machine, with water spray pressurized by high pressure water pump.

Operating conditions

Under the premise of meeting the following operating conditions, select a suitable type of humidifier according to the necessary humidifying capacity and the following technical parameters;

---Supply water quality: Tap water, purified water or equivalent

---Water Pressure: 1- 3.5kg/m²

---Water Temperature: 5- 50°C

---Air Velocity: 0.5- 3.5m/s

---AirTemperature: 20- 60°C

★ Note

1、The above moisture quantity is the maximum value for different types of wet-film humidifiers.

2、The fresh air ratio is 30% .

Wet-film humidifier

The wet-film is a hydrophilic material which uniformly distributes the water contained over the material surface to form a gasification layer of water. When the air flows through the material surface, the water in the gasification layer is evaporated and gasified, and absorbed by the air. The vaporizing humidifier is produced according to this principle. The wet-film can be of thickness 50 or 100 mm depending on the moisture quantity demand, with water supply being three times of the moisture quantity.

Operating conditions

Air Temperature Humidifier:5-80°C ; ≤90%RH

Air Velocity : ≤3.75m/s

Supply water quality: Tap water, purified water

Water Condition:0.05-0.4MPa, 5-40°C

Water supply = 2-3 * moisture quantity, external water supply interface size: DN 15 G1/2

Power Supply AC220V/50HZ

★ Note

1、Conditions of fresh inlet air: 28°C DB, 10% RH; air face velocity < 3.0 m/s.

2、Conditions of mixed inlet air (fresh air ratio 30%): 28°C DB, 25% RH; air face velocity < 3.0 m/s.

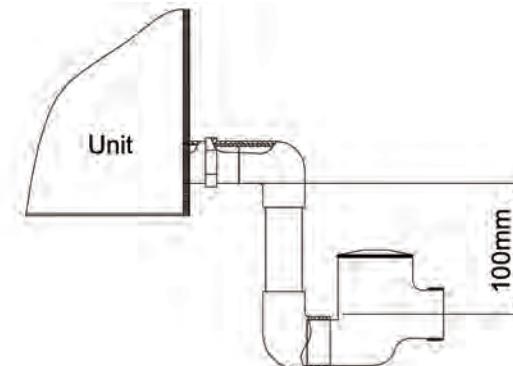

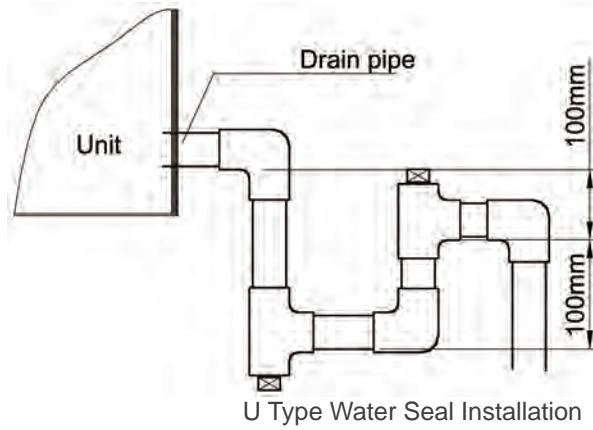

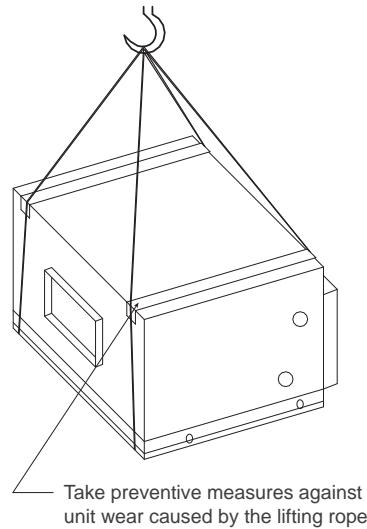

3、The above wet-film weight is dry weight without introduction of water; the operating weight (wet weight) of wet-film humidifier is about 1.5 times the dry weight.

4、The above moisture capacity is the maximum value for different types of wet-film humidifiers.

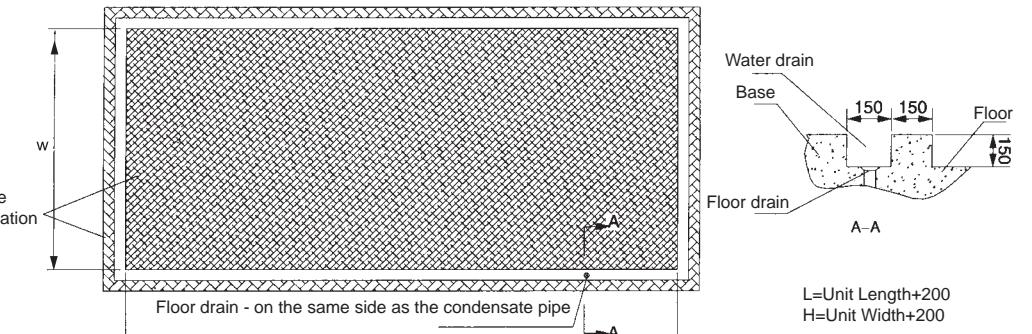

5、If TAD series unit comes with a wet-film humidifier, the internal resistance shall be increased by 50 mm-20 Pa ,100 mm-30 Pa,150 mm-45 Pa,200 mm-60 Pa correspondingly.

Installation

- Carefully check the unit for damage before installing it, and please contact the retailer for repair and replacement under any of the following conditions: impact or serious deformation of the unit, obvious scratch that affects the appearance of the unit panel or housing, and looseness or breakaway of the fan or motor.
- For the purpose of safety, hoist the ceiling-mounted unit firmly in the way as shown in the figure on the right, or load/unload and move it with a forklift, ensure the hoisting point is firm with sufficient strength to bear the unit weight and make sure the unit is level.
- Before wiring, check whether the power supply voltage, frequency and phase are consistent with the unit and ensure the power supply voltage deviation doesn't exceed $\pm 10\%$ of the rated voltage. Before starting the fan, get into the fan case and rotate the fan impeller by hand, carefully check whether there is any metal scraping sound and eliminate the abnormality if any. After switching on the power supply, start the fan, check whether the impeller rotates in the correct direction. In case of incorrect rotation direction, just change the phase sequence of the power supply incoming line.
- It is recommended that a plenum chamber be set at the unit air inlet/outlet, an air volume control valve on the air duct and a fire damper in accordance with fire control requirements. If an electric air volume control valve is installed, start the air valve actuator and then the fan, while close the fan and then the air valve actuator.

- Wash the water pipes before connecting them. Pay attention to the cold (hot) water inflow and outflow directions, connect the pipes as per the marks on the unit, and equip the unit water inlet pipe with a valve and a filter to adjust the flow. In case of overhauling, cut off the cold (hot) water source, prevent impurities from entering the heat exchanger so as not to block it, and use insulated water inlet and outlet pipes for thermal insulation.
- When connecting the water inlet and outlet pipes, fix them with a pipe tong and prevent them from being subject to a torsional force during operation. It is recommended that Teflon tape be used for sealing to avoid water leakage. Condensate water from the unit must be connected at a certain water seal height and drained into the sewer through a drain pipe as shown in the figure above.
- Never make the unit bear the weights of air duct, water pipes, etc. connected with it.
- Earth the unit reliably, and check whether the electric circuits are in good conditions and comply with the electric safety requirements.
- Make sure the unit is installed by professionals who are familiar with the product and relevant local rules and avoid impact, pressing and scratch during installation.

Precautions for installation and use

- Switch off the power supply when the unit doesn't operate for a long time or in winter.
- To avoid an electric shock, a fire and other possible injuries, always keep in mind the following rules and observe them:
- Never try to install or modify the A/C unit by yourself for improper operation (if any) may cause water leakage, electric shock and fire.
- Never connect the grounding wire of the A/C to the gas pipe, tap water pipe, lightning rod, etc.
- Use the accessories specified by the company and ask the manufacturer or authorized dealer to provide installation and technical services.
- Isolate the unit controller data line and the power supply line to avoid interference.
- Never damage the power supply line, and never turn on or off the A/C unit by plugging or unplugging the power supply.
- Never flush the A/C unit with water directly, otherwise, electric shock or other accidents may occur.
- Never try to repair by yourself for improper repair may cause operation fault or burnout to the unit; please contact the local branch or authorized service provider if repair is needed.
- The air conditioning unit shall not operate in corrosive gas environment, for instance, acid, alkali, salt mist, etc. Otherwise, it may lead to the damage to the unit enclosure, pipeline or electrical elements.
- The space around the unit shall be kept clean, dry and well-ventilated. In case the heat exchanger on the air side can be cleaned regularly (at the interval of 1~2 months), its good heat transfer effect can be maintained and the energy can be saved.
- The drain pipe must be laid according to the requirements in the Instruction to ensure smooth water drainage and proper measures for thermal insulation shall be taken to prevent the generation of condensate. The drain pipe must be inspected before the unit operates. In case of blockage, foreign matters must be eliminated to ensure smooth drainage of the condensate.
- The wiring of the power supply and the electrical system for the unit shall be inspected frequently to confirm whether the wiring is firm, whether electrical elements operate abnormally. In case of abnormalities, the repair and replacement shall be performed in time and the regular inspection shall be conducted to confirm whether the grounding is reliable.

- The minimum startup voltage of the unit must be kept above 90% of the rated voltage, the voltage during operation must be within $\pm 10\%$ of the rated voltage and the voltage difference among all phases shall be within $\pm 2\%$. Overvoltage or undervoltage will have adverse effect on the unit. Stable power supply shall be guaranteed and in case of unstable voltage, excessive current will be generated at the moment of unit startup for operation, and this may damage the unit motor.

- The unit maintenance and repair can only be conducted provided that the unit is shut down and it is disconnected with the power supply.

- In case of unit failure, it can only be started after causes for the failure are identified and eliminated and no forced startup shall be conducted before the failure is not eliminated.

- No short connection of the lines for the unit protection device shall be conducted. Otherwise, this may lead to the unit failure.

- The internal cables of the unit shall be protected properly to prevent the insulation layer from damage due to sharp objects. The wire and cable shall be kept far away from the heat source and they shall not be bent or twisted

Air filter

The accumulated dust of the unit strainer shall be inspected regularly (twice for each month as recommended). Users who have installed differential pressure detector shall clean or replace the filter in case the final resistance reaches the specified value and TICA suggests that the final resistance value shall be:

specification of filtration efficiency	suggested final resistance (Pa)
G3	100-200
G4	150-250
M5-M6	250-300

Heat exchanger

The coil fin, copper pipes, etc. of the heat exchanger shall be free from scratch or flattening due to impact. The coil shall be kept clean and the coil fin can be brushed and washed with the nylon brush. It shall be cleaned with the vacuum cleaner before brushing. In case of the compressed air, the coil may be cleaned with the high-pressure air pipe or nozzle. Upon the cleaning of the coil, its external surface shall be free from dust and the heat transfer effect of the internal surface shall reach its initial updating and heat transfer capacity. Besides the fin cleaning, internal incrustation shall be washed and removed from the coil after the coil has been used for 2~3 years. The cold water and hot water for the unit coil shall be softened water.

- The belt tightness shall be readjusted after the unit has operated for one week and the regular inspection shall be conducted every three months of operation in future.

- The wiring pile head of the wire will be loosened after the unit operates for a certain time. It shall be inspected and tightened on the third day upon the first startup.

- Bearings for the fan and the motor shall be inspected regularly (three times per month as recommended). The seal ring of the motor bearing (for instance, V-seal ring) shall be inspected, and it shall be replaced timely if necessary; the erection joint shall be inspected to confirm whether it is loose; the bearing operation shall be inspected through monitoring the abnormal noise, vibration, oil consumption or with the bearing vibration measurement element, etc. In case of any abnormalities, the unit shall be shut down immediately, and causes shall be identified and eliminated timely. Heating shall be conducted or special tools shall be used for the assembly and disassembly of bearings and bearings shall not be knocked violently or moved.

Servicing of fan bearing:

For fans with the oil nozzle, the lubricating oil of matching specification shall be filled into the bearing regularly. In case that the users select the grease of the same designation for grease filling, they shall use the grease of the designation all the time.

- The validity of the lubricating grease depends on the grease type, revolving speed of bearings, bearing diameter and operating environment. Under normal conditions, the lubricating grease shall be replaced after the fan has operated for about 1,500 h; in case that the fan keeps 24-hour operation, the lubricating grease shall be replaced upon 500~700-hour operation.

- Methods for lubricating oil filling: the bearing shall keep rotating during the grease filling, and in case that a layer of fresh grease overflow from the dust cover, the grease filling may be stopped and the wind wheel shall be rotated quickly manually to discharge excessive grease.

- Check the sealing strip of the access door and the flexible joint of the air duct regularly (once per month), and timely replace them in case of air leakage.

Other precautions:

- Clean the A/C only after turning off the unit and switching off the power supply, otherwise, you may get electrocuted or injured.
- Never conduct overhauling during unit operation.
- Never replace the fuse with a steel or copper wire. Please use the fuse of correct specification, otherwise, the unit may be damaged.
- Switch off the power supply and ask the retailer for guidance in case of any abnormality (e.g. scorched flavor). If the A/C unit is still used in such a case, it may be damaged and an electric shock or fire may occur. Maintenance can only be performed by professional maintenance personnel. All power supplies must be switched off before the devices are wired.
- Refer to the Installation Manual for other unmentioned matters.

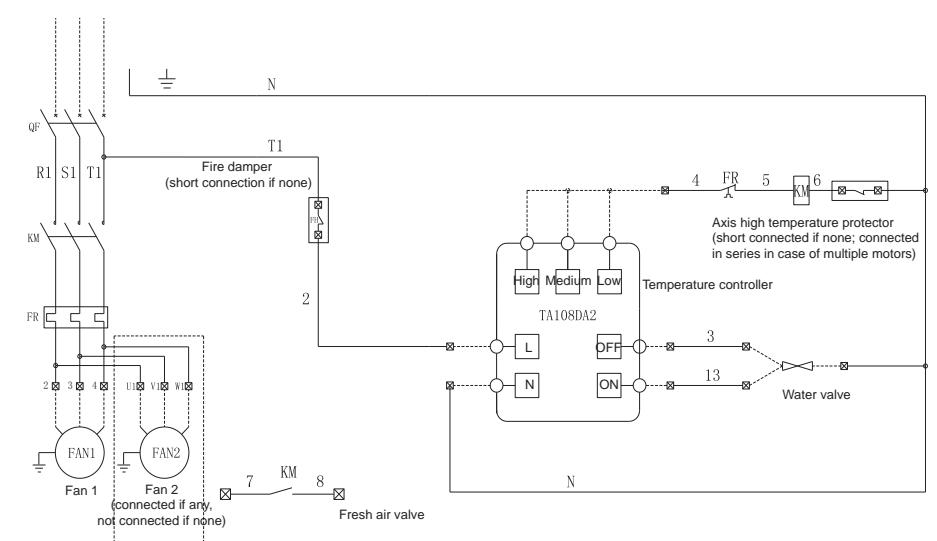

- Note: The unit components (e.g. humidifier, runner heat recovery device, burner and spray system) must be operated, repaired and maintained as per their attached operation or maintenance manuals or user's manuals containing detailed regulations on operation, repair and maintenance if any.

Electric Wiring Diagram

Installation instructions for the control cabinet

When the motor power is less than or equal to 7.5 kW, the control cabinet is installed from the side or top of the TAD unit, with the motor wiring completed. The temperature controller is supplied randomly and installed on the wall of the indoor operation room on site through remote control. Wires to be connected on site include the power supply line of the control cabinet and the signal line between the temperature controller and the control cabinet.

When the motor power is greater than or equal to 11 kW, the motor is started in the star-delta mode, the control cabinet is supplied separately as an accessory, wires including the power supply incoming line of the control cabinet and the motor power supply line between the control cabinet and the motor are connected on site, and the temperature controller has been installed on the control cabinet panel.

Other instructions

Connecting the water valve is energy-saving, but never install the water valve in the full fresh air mode for the purpose of anti-frost protection.

Maintenance And Service

The air conditioning unit is an equipment and users are suggested to record the daily operation data of the equipment and to conduct regular maintenance and service.

- 1、The following inspections shall be conducted properly before the use of the equipment:
 - ◆ The power supply wiring of all indoor end equipment shall be inspected to confirm whether there is wrong wiring and whether the fan rotation is normal.
 - ◆ The inspection shall be conducted to confirm whether all air valves at the inlet and outlet of the indoor end equipment are open.
 - ◆ The inspection shall be conducted to confirm whether all power supply lines and control lines are connected in position and whether the wiring is correct according to the wiring diagram, whether the grounding is reliable and whether all connection terminals are secure.

2、Daily maintenance during the equipment use:

Unit maintenance contents	Standard service cycle			Remarks
	Monthly	Quarterly	Half a year	
1、The inspection shall be inspected to confirm whether the power line (from the distribution cabinet to the unit) is loose or damaged.			★	
2、The inspection shall be conducted to confirm whether the condensate discharge is normal		★	●	Is the installation conducted according to the pipe connection diagram? Is it dirty or blocked? Is the drainage smooth? Is there any overflow, etc. due to this?
3、The inspection shall be conducted to confirm whether there is abnormal noise during the operation of the unit.	★		●	For instance, sharp metal friction sound, whistlers, obvious clash or resonance, significant electromagnetic noise (disgusting) and other abnormal noise.
4、The inspection shall be conducted to confirm whether it is necessary to clean the air side of heat exchanger (surface dust, sundries, etc.)		★	●	Spaces among fins are full of dust and there are sundries attached on the inlet side of the coil, etc.
5、The inspection shall be conducted to confirm whether the air strainer is dirty or blocked and whether it is necessary to clean or replace the strainer.	★	●		The differential pressure alarm value and the scale value in the differential pressure gauge reach the final resistance value, etc.

- 3、We recommend the following maintenance and service methods for the equipment which is not used for a long time

- ◆ In case that the unit does not operate for a long time or does not operate in winter, the power must be turned off and the water shall be discharged from the water system and the steam coil of the unit.

- ◆ If necessary, the maintenance and service may be conducted according to the pre-use maintenance and service methods of the equipment.

★ Note

- 1、User service: mandatory inspection - ●recommended inspection - ★
 - 2、Vulnerable parts required for the service shall be purchased from TICA Air-Conditioning Co., Ltd.
 - 3、The service methods apply to the cycle during normal use and the arrangement shall be made based on actual conditions in case of use in bad conditions.
